

# ATMR6 SFP IR MOA

Talos BTR GEN2 1-4x24 Riflescope

**SECOND FOCAL PLANE**

**RETICLE MANUAL**

## THE ATHLON® ATMR6 SFP IR MOA RETICLE

ATMR6 SFP IR MOA reticle is designed for the fast CQB or mid-range engagements. The 2 moa center dot with 20 moa illuminated quartered half circle aids in rapid acquisition for close range targets or hunting and stalking in thick brush. The drop compensation is suitable for many standard and magnum calibers out to 600 yards.

**Application:** Short and Mid Range Hunting and Tactical application

## RETICLE SUBTENSIONS

The ATMR6 SFP IR MOA reticle is based on the minute of angle, a unit of angular measurement, usually shortened to moa. A "moa" is defined as "one minute of an angle". As a full circle has 360 degrees, and each degree is composed of 60 minutes (60'), thus there are 360 (degrees) x 60 (minutes) = 21,600 minutes in a circle. Since there are 360 degree in a circle, we can get 360 degree/21600 minutes = 0.016667 degrees/minute. If the target is 100 yards ( 3600 inches) away, we can use a formula,  $3600 * \text{TAN}(\text{RADIANS}(.016667))$ , to get 1.047 inches which means 1 moa equals to 1.047 inches at 100 yards. Many people just round down the 1.047 inches to 1 inch @100 yards. If you are using metric system, formula  $100000\text{mm} * \text{TAN}(\text{RADIANS}(.016667))$  gets you that 1 moa equals to 29.1mm @100 meters.

The ATMR6 SFP IR MOA reticle is located at the second plane which stays in between erector tube and ocular lens. The size or the appearance of a second focal plane reticle does not change when you try to zoom in or zoom out, however the relative ratio between reticle and your target changes all the time because your target appears bigger or smaller when the magnification changes.

The subtensions of a second focal plain reticle and ranging capability are only accurate at certain magnification and due to this nature, the subtensions of the ATMR6 SFP IR MOA reticle is only valid at 4x for 1-4x24 scope.

**SUBTENSIONS IN MOA**

| A1   | A2  | A3 | B1  | B2  | B3  | C1  | C2  | C3  | C4  | C5   |
|------|-----|----|-----|-----|-----|-----|-----|-----|-----|------|
| 0.45 | 3.5 | 2  | 35  | 3   | 2   | 2   | 2.4 | 5.6 | 9.5 | 14.6 |
| C6   | C7  | C8 | C9  | C10 | C11 | C12 | C13 | D1  | D2  |      |
| 4    | 3   | 2  | 2.8 | 3.9 | 5.4 | 6.8 | 1   | 2   | 23  |      |

## EXAMPLE

### HOLDOVER FOR COMPENSATING BULLET DROP

To be able to use the elevation holdovers effectively, you have to know the distance to your target and bullet trajectory (bullet drop in inches or moa). Since many bullet ballistic charts highlight bullet drops in inches and 1moa equals to 1.047 (rounded down to 1 inch) at 100 yards, 2 inches at 200 yards, and 10 inches at 1000 yards, etc, we can use those to calculate the holdover position in moa on this reticle.

For example, under no wind condition, if you knew your target is at 300 yards and your ammo has a 7.2 inch bullet drop at that distance, you want to use 2.4 moa holdover point. Here is how you got the 2.4 moa: since 1 moa equals to 1 inch x 3 =3 inches at 300 yards, and then 2.4 moa equal to 2.4 x 3 inches =7.2 inches at 300 yards, you want to hold the 2.4 moa drop point to compensate the 7.2 inch bullet drop.

To achieve ultimate precision, it is always a better idea to develop your own D.O.P.E (Data of Previous Engagement )chart so that you can refer back to it for specific bullet drop compensation under different ambient environment and weather condition.

The ATMR6 reticle is designed for 68 and 69 grain BTHP 223 Rem/5.56 mm NATO rounds. It is also suitable for many other bullet weights in these calibers.

Bullet holdovers for target at every 100 yards. No wind.  
Zeroed at 200 yards, ballistic calculation based on 68 grain hornady  
and 69 grain sierra cartridge.

## HOLDOVER FOR WIND CORRECTION

The flying time of a bullet, the velocity and direction of the wind and the “slippery-ness” of the bullet expressed in BC (Ballistic Coefficient) determine your holdover for wind correction. Once again you have to understand the impact of those three factors on your bullet’s flying path in terms of inches or moa and calculate how much holdover you have to hold, and then finding the corresponding holdover position on the reticle is a much easier task to accomplish.

### EXAMPLE

5 mph wind from left to right, holdover for wind correction at every 100 yards.

## THE ATHLON GOLD MEDAL LIFETIME WARRANTY\*

Demand the most from your equipment. When things go unexpectedly or accidents happen, rest assured, Athlon Optics carry a lifetime transferable warranty. Athlon guarantees to repair or replace your product if damaged through normal use. No charge; No receipt; No Registration required.

*\*This warranty does not cover damages caused by deliberate damage, misuse, theft or maintenance provided by someone other than the Athlon Authorized Service Department.*
